

HOW IT WORKS

Belvedere. Your Agentic Data Manager.

Belvedere is an agentic data manager, **designed to 10x your data engineers and data curators.**

Declare the data product you need in plain language, and Belvedere's AI agents handle everything behind it: discovery, governance, and pipeline generation, all on your existing infrastructure, including air-gapped networks.

01

Declare the outcome

Describe the data you need in plain language. No scripting, no manual plumbing, no vendor lock-in.

02

AI discovers & catalogs

Agents scan every source, whether cloud, on-prem, or air-gapped, and infer schema, classification, and governance automatically. PII detection and releasability controls are built in.

03

AI designs the pipeline

Agents propose the pipeline as a visual graph you inspect and refine through dialogue. Plain language in, deterministic code out. No hallucinations.

04

Compile, approve, deploy

Approved designs compile into tested, auditable orchestration code running on your own infrastructure. A human approves every change before deploy, and every action lands in the audit trail.

Agents do the engineering and curation work; your people set intent and make the calls. **One engineer runs what used to take a team**, and the pipelines themselves run as deterministic, verifiable code with the provenance and human control accredited environments require.
